RISK MANAGEMENT 101

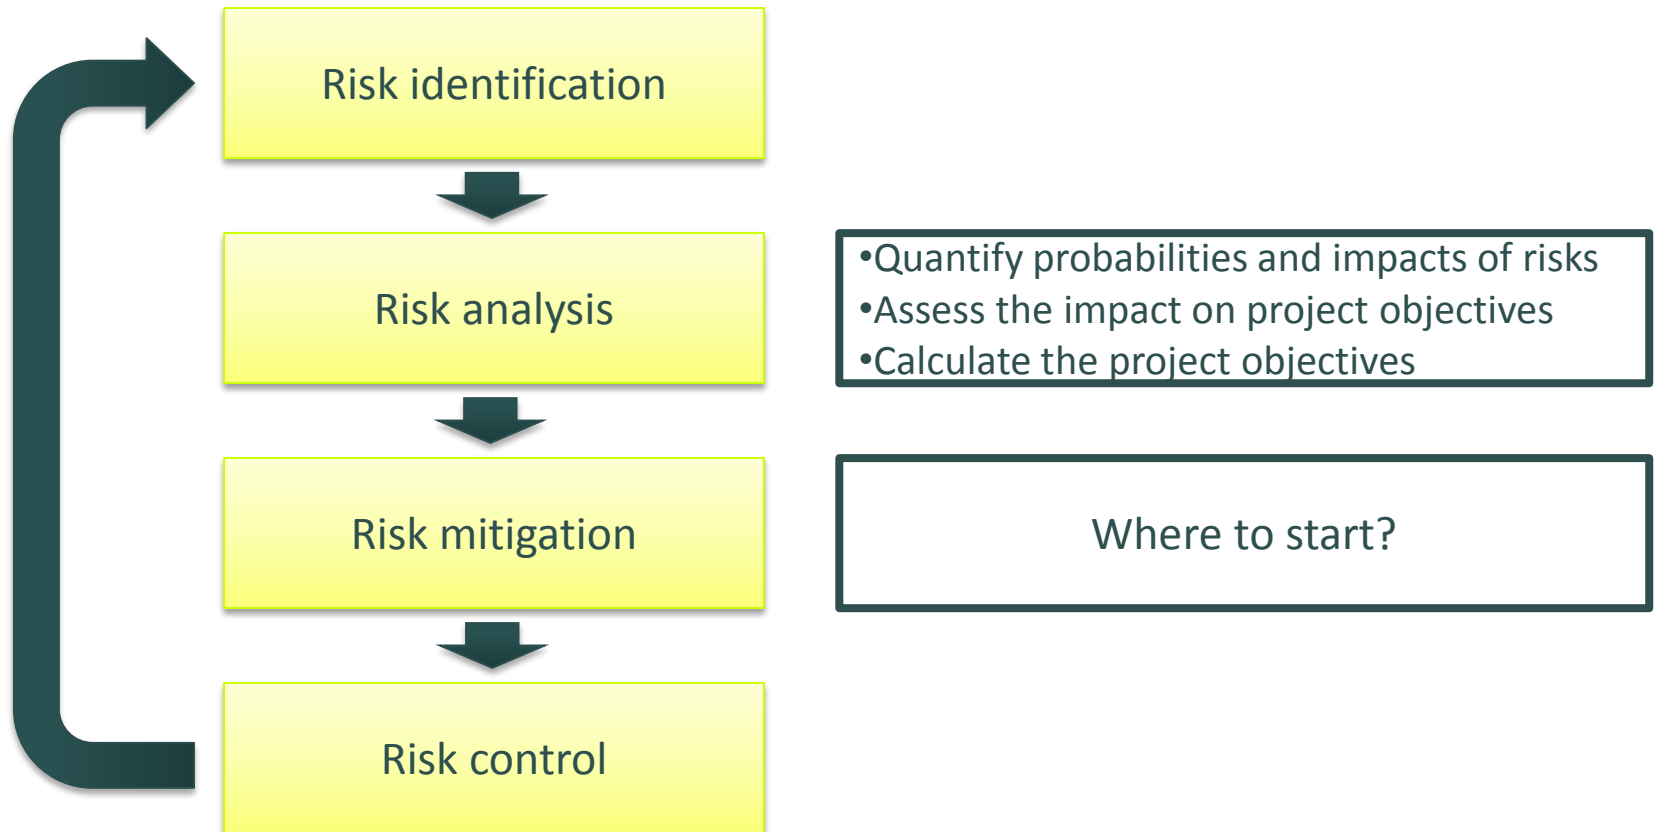

RISK MANAGEMENT 101

- Quantify probabilities and impacts of risks
- Assess the impact on project objectives
- Calculate the project objectives

RISK MANAGEMENT 101

PROJECT RISK MANAGEMENT: CURRENT APPROACH

- Model uncertainty in activity durations
 - Normal distribution
 - Triangular distribution
 - Beta distribution
- Apply Monte Carlo Simulation to simulate project objectives
 - Probability that project finished before a certain date

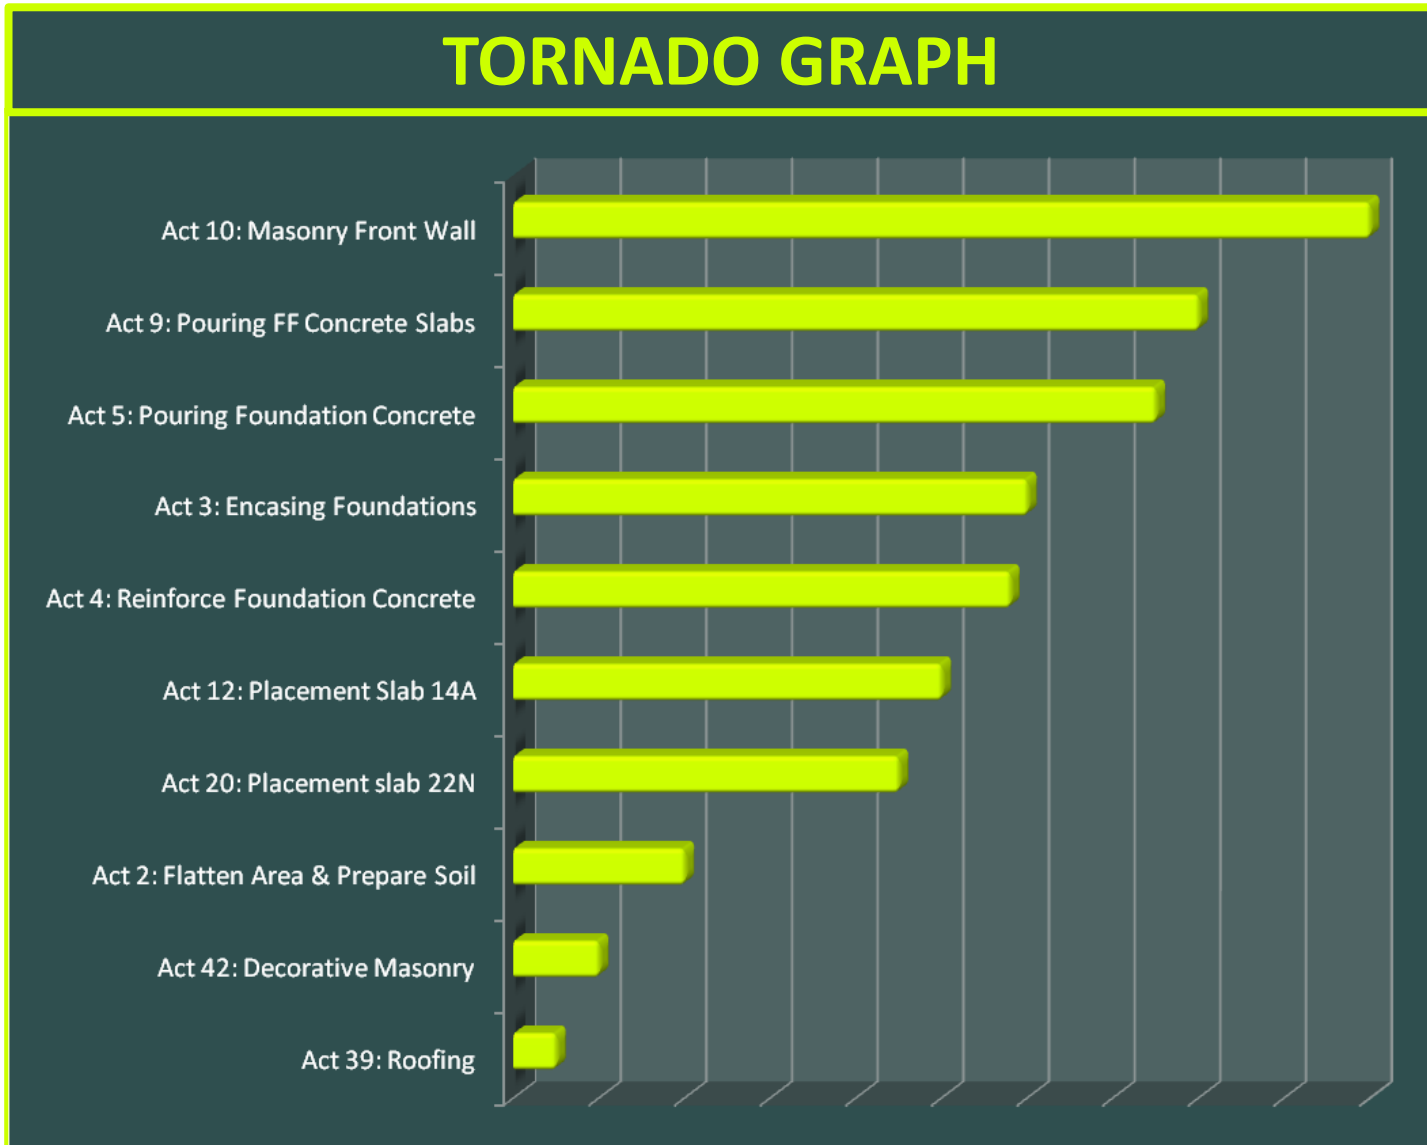

PROJECT RISK MANAGEMENT: CURRENT APPROACH

- Model uncertainty in activity durations
 - Normal distribution
 - Triangular distribution
 - Beta distribution
- Apply Monte Carlo Simulation to simulate project objectives
 - Probability that project finished before a certain date

Analysis needs to
be followed by action
=>
Risk mitigation is required

RISK MITIGATION: RANKING OF MOST SENSITIVE ACTIVITIES

RISK MITIGATION: RANKING OF MOST SENSITIVE ACTIVITIES

TORNADO GRAPH

Focus mitigation efforts on the most sensitive activity; the activity that has the highest rank

CURRENT RANKING MEASURES

- Criticality Index

$$CI_i = P(ES_i = LS_i)$$

- Significance Index

$$SI_i = E \left[\frac{d_i}{d_i + TF_i} \times \frac{C}{E(C)} \right]$$

- Cruciality Index

$$CRI_i = \text{corr}(\mathbf{d}_i, C)$$

- Schedule Sensitivity Index

$$SSI_i = \sqrt{\frac{\text{Var}(\mathbf{d}_i)}{\text{Var}(C)}} \cdot CI$$

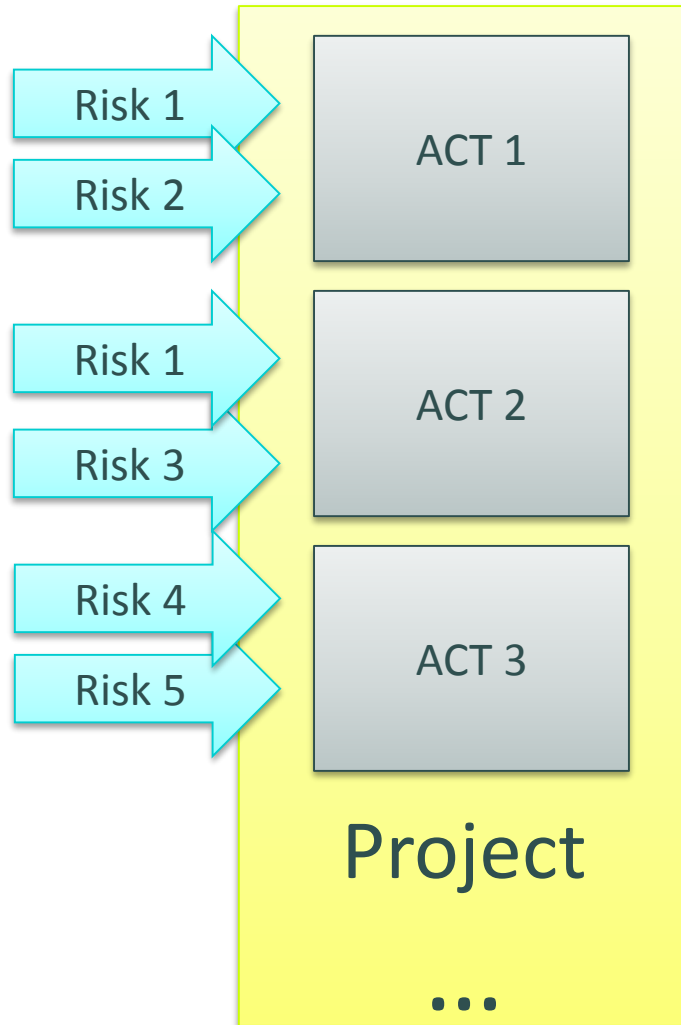

- ...

PROBLEMS WITH CURRENT APPROACH

- Project managers have a very hard time to model uncertainty
- All of the previous ranking measures have been criticized
- It is not clear where the uncertainty originates from
- It is unclear how to mitigate uncertainty

NEW APPROACH: RISK-DRIVEN (INSTEAD OF ACTIVITY-BASED)

$$d_i = f(d_i, r_{ij})$$

Activity duration distribution (ACT 1)

Risk 1

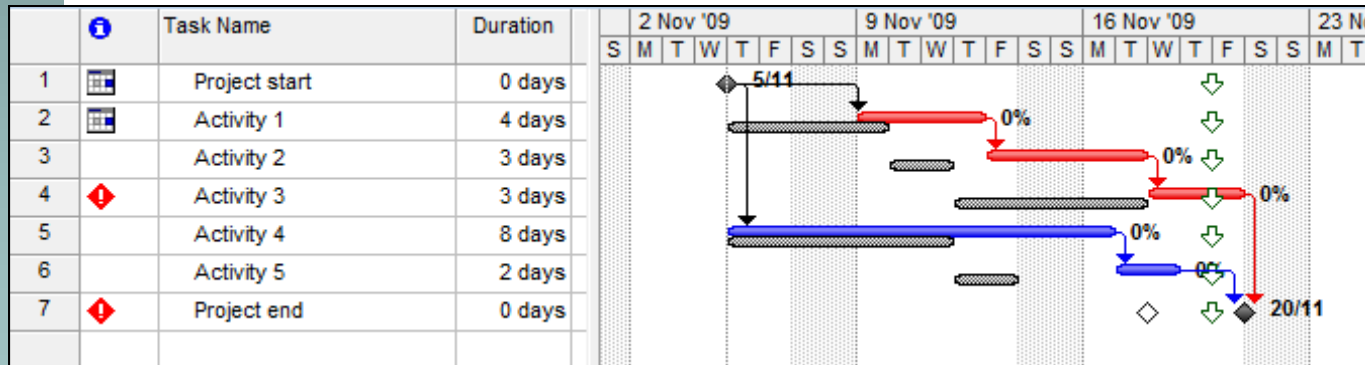

Risk 2

Risks 1&2

PROPOSED RANKING MEASURES

- Cruciality Index (literature) $CRI_j = corr(\mathbf{r}_j, \mathbf{C})$

- Critical delay contribution $CDC_{ij} = E \left[\frac{\mathbf{r}_{ij} \cdot \mathbf{y}_{ij}}{\sum_i \sum_j \mathbf{r}_{ij} \cdot \mathbf{y}_{ij}} \cdot (\mathbf{C} - \delta) \right]$

	Delay	CDC
Act 1	+3	0.6
Act 2	+2	0.4
Act 3	-1	0
Act 4	+3	0
Act 5	0	0
TOT	$C - E(C) = 4$	$C - \delta = 1$

ADVANTAGES OF THE NEW APPROACH

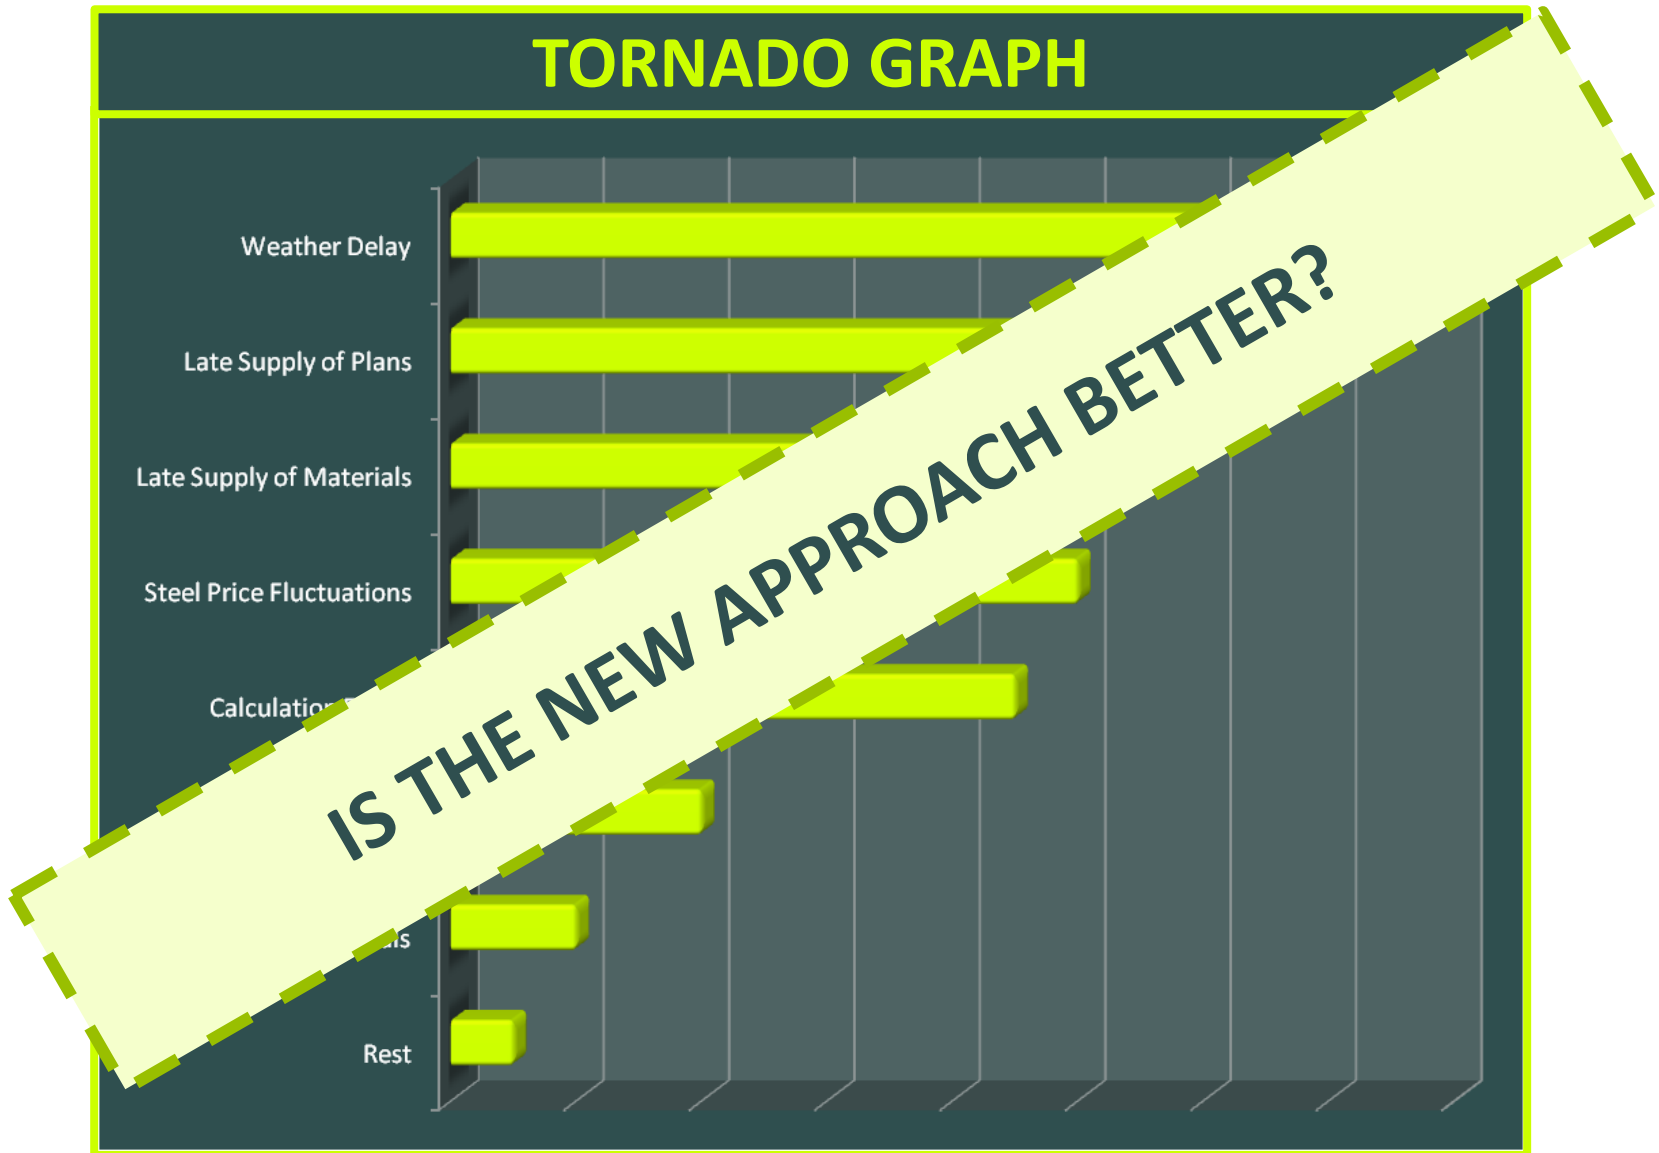

- Risks are much easier to predict than uncertainty
- CDC is calculated on risk per activity basis and can be aggregated on the level of risks and activities
- Risks **root** causes are ranked

TORNADO GRAPH USING RISK-DRIVEN RANKING MEASURES

TORNADO GRAPH USING RISK-DRIVEN RANKING MEASURES

EVALUATING THE NEW APPROACH: COMPUTATIONAL EXPERIMENT

- For a large set of projects (600 projects of PSPLIB 120):
 - Model uncertainty (i.e. define risks, impacts, probabilities...)
 - Simulate the project execution
 - For each ranking measure:
 - Calculate the highest-ranked risk according to the measure
 - Eliminate the highest-ranked risk (i.e. focus our mitigation efforts on this risk)

How good do the measures
perform when mitigating 10 risks?

COMPUTATIONAL EXPERIMENT: RANKING MEASURES

ACTIVITY-BASED

=>

SELECT THE LARGEST RISK THAT IMPACTS
THE HIGHEST-RANKED ACTIVITY

CDC ACT

CI ACT

CONCLUSIONS

- A risk-driven approach to project risk analysis is preferred
- CDC is able to outperform current best practice measures (activity-based AND risk-driven)
- CDC is very close to greedy optimal
- Recommendations are insensitive to parameter settings:
 - Different settings of risk probabilities and impacts
 - Risk occurrences correlated or not?
- Future research: Optimal approach is future research
